Phase 2: Preferred Seawall Replacement Option

Key advantages of the preferred option

- The beach huts can remain in place for the duration of the works (although access will not be permitted).
- This option has the least environmental impacts.
- Shortest construction duration, minimising impacts to the local area.
- The sheet pile wall is the most cost effective option.
- The existing seawall can be partially encased within the new seawall reducing demolition costs and disturbance.

The preferred option allows for a wider, straighter promenade at the “kink”. This removes this weak point in the seawall and creates more public space.
